1 Introduction

As part of the closure and decommissioning process, Rio Algom Limited (RAL) and Denison Mines Inc. (DMI) developed a focused and integrated performance monitoring network for legacy sites within the Serpent River Watershed (SRW). The comprehensive monitoring and management strategy clearly defined and delineated the purpose for all monitoring activities through three integrated programs; the Tailings Management Area (TMA) Operational Monitoring Program (TOMP), the Source Area Monitoring Program (SAMP), and the Serpent River Watershed Monitoring Program (SRWMP) (Minnow Environmental Inc. (Minnow), 2019). An integrated assessment of the results from the monitoring programs is prepared every five years in a *State of the Environment Report* (SOE) in compliance with license requirements and in accordance to Canadian Standards Association (CSA) N288.4-10 (2010). The regulatory review of the most recent SOE (Cycle 5, inclusive of data from January 1, 2015 – December 31, 2019) was submitted to the Joint Regulatory Review Group (JRG)¹ on March 31, 2021.

The SRWMP was initiated in 1999 as a joint initiative of RAL and DMI with the objectives of evaluating the effectiveness of mine decommissioning plans and assessing long-term environmental water quality trends in the watershed (Beak International Incorporated (Beak, 1999). Evolution of the program, key outcomes, program modification decisions, and associated references are summarized in Appendix I. In 2021, the SRWMP followed the 2020 program modifications recommendations described in the document submission entitled *Cycle 5 Study Design for the SRWMP, SAMP and TOMP (Cycle 5 Study Design, (Minnow, 2019).*

The SRWMP Annual Water Quality Report for 2021 provides water quality data from watershed monitoring locations from January 1, 2021 through December 31, 2021. This report should be read in conjunction with the Annual Operating Care and Maintenance (OCM) reports, prepared independently by each company, which provides a summary of operational activities completed at the facilities as well as presents data collected as required by the SAMP and TOMP (RAL, 2022; DMI, 2022). The objective of the SRWMP annual data review is to identify anomalous data and evaluate short-term data trends at key locations. Step changes and anomalies are identified in this report by reviewing and compiling the last five years of annual average data for all SRWMP monitoring locations, and reviewing the information for any noticeable changes. Significant changes and unusual results are investigated in accordance with the *Water Quality Assessment and Response Plan*, which is found in *Appendix A* of the most recent SOE Report (Minnow, 2021).

The SRWMP Annual Water Quality Report for 2021 also provides a summary of the data quality management program and water quality results for the period January 1, 2021 through December 31, 2021.

As part of the 2015 SOE review, the Canadian Nuclear Safety Commission (CNSC) instructed RAL and DMI to include annual reporting of a representative radiation dose to the public associated with their closed uranium mine sites in the SRW. Details on this topic are discussed in Section 4.4 of this report.

¹ The JRG is a multi-stakeholder committee composed of representatives from the Canadian Nuclear Safety Commission (CNSC), Department of Fisheries and Oceans (DFO), Environment Canada (EC), MECP, Ontario Ministry of Natural Resources and Forestry (MNRF), Ontario Ministry of Labour (MOL) and the Ontario Ministry of Northern Development and Mines (MNDM). The JRG continues to participate in the programs through reviewing study design reports and interpretive reports for the TOMP, the SAMP, and the SRWMP.

2 METHODOLOGY

2.1 2021 Program Requirements

The 2021 SRWMP followed program requirements (sampling locations, frequencies, parameters, and analytical protocols) as approved in the Cycle 5 Study Design (Minnow, 2019). Table 2.1 provides a brief description of each monitoring location, the frequency and parameters monitored. Figure 2.1 provides a map of the stations included in the water quality monitoring program.

Notes

- 1. Field QA-QC designated stations.
- 2. Wetland reference locations for the SRWMP and SAMP Cycle 5 Design Study (Minnow 2019).
- 3. Hardness is an ancillary parameter used to assess manganese and sulphate as both parameters are hardness dependant (Ambient Water Quality Guidelines) (BC ENV 2019)
- 4. DOC was added as a qualifier for iron as per the proposed Federal Water Quality Guideline (ECCC, 2019).
- 5. Ontario Ministry of the Environment, Conservation and Parks (MECP) required sampling as per Nordic Environmental Compliance Approval, NUMBER: 0001118756. rev .01, Sept, 2020.

Rio Algom

2.2 2021 Program Conformance

All Cycle 5 sampling, field measurement, and analytical requirements were met during the 2021 reporting period, with the exception of two flow measurements. Although all samples were collected, flow could not be measured at D-6 and DS-18 in February due to thick ice build-up across the channels.

Hardness continues to be monitored as an ancillary parameter at all SRWMP stations. According to the Approved Water Quality Guidelines for Aquatic Life, Wildlife & Agriculture from the British Columbia Ministry of Environment & Climate Change Strategy (BC ENV), manganese and sulphate guidelines are hardness dependent (BC ENV, 2019). Dissolved Organic Carbon (DOC) was added into the monitoring program at the recommendation of the Ontario Ministry of the Environment, Conservation, and Parks (MECP). DOC data is provided in Appendix V for 2021, however, it has not been used for iron assessment in this report, as the upper level of background for iron is higher than federal guidelines. Changes to the program are discussed in further detail in Section 4.2.

2.3 Field Measurements

Field measurement requirements and protocols for the 2021 SRWMP are presented in detail in the *Cycle 5 Study Design* (Table 6.2, Minnow, 2019). Field Staff have been thoroughly trained and have reviewed procedures associated with the proper calibration and use of field equipment for the measurement of field parameters. The models and accuracy for equipment used in measuring SRWMP field parameters are provided in Table 2.3.

Table 2.3 SRWMP Field Equipment Models and Accuracy

Parameter	Meter	Accuracy	Unit
pH	YSI Pro 10	+/- 0.02	pH units
flow	Global Flow Probe	0.1	feet per second

2.4 Data Quality Objectives

Field and laboratory data quality objectives (DQOs) for the 2021 SRWMP are presented in detail in the *Cycle 5 Study Design* (Minnow, 2019). Table 2.4.a. provides a summary of field DQOs and Table 2.4.b. provides a summary of laboratory methods, detection limits and DQOs. Data quality assessment results are provided in Section 3.

Table 2.4.a. 2021 SRWMP Field Data Quality Objectives

		Assassma	nt Criteria ¹		Data Quality	Objectives ²

2.5 Changes in Analytical Methods

After the unexpected closure of Laurentian University's laboratory, Perdue, formerly the Elliot Lake Research Field Station (ELRFS) at the end of April, 2021, samples analyzed for radium-226 were sent to Testmark Laboratories Ltd (Testmark). However, after receipt of historically high radium results at multiple locations and a lack of precision in repeat results, an investigation into the laboratory method for radium-226 was conducted. Testmark's analytical method for radium-226 utilized 7500 Ra-B – Precipitation Method from "Standard Methods for the Examination of Water and Wastewater" (2011), heavily referencing Environmental Protection Agency (EPA) Method 903.0 "Alpha-Emitting Radium Isotopes in Drinking Water" (1980) and EPA Method 900.0 "Gross Alpha and Gross Beta Radioactivity in Drinking Water" (1980). Although Testmark's current method is approved with Canadian Association for Laboratory Accreditation (CALA), the investigation found that Testmark was utilizing an alpha/beta counter and not an alpha spectrometer, essentially counting all alpha particles and reporting them as radium-226. This is problematic when analyzing waters impacted from uranium mines which other alpha emitters can influence results.

Due to the discrepancies in Testmark results, comparison radium-226 samples were sent to SGS laboratories through the month of September to determine accuracy and precision in results. SGS radium-226 analytical method utilizes the Eichrom Application Note AN-1401-10, Rapid determination of Ra226 in Emergency Urine and Water (2018) with use of the Alpha Spectrometry System. Subsequent radium-226 results from SGS indicated consistency with historic results and precision of repeat results were well within the DQO of 20%. Beginning October 01, 2021, radium-226 samples were sent to SGS exclusively.

2.6 Reporting of Method Detection Limits

Program method detection limits (MDLs) are presented in Tables 2.4.a. and 2.4.b. The target MDL for radium-226 (0.005 Bq/L) was not met on all samples analysed from January to April in 2021 due to decreased sample throughput of the analytical laboratory. There was no change in method during this period; however, the laboratory was only able to claim a MDL of 0.007 Bq/L. However, both Testmark and SGS were able to meet the MDL of <0.005 Bq/L, this is reflected in the dataset for 2021 beginning May 2021.

2.7 Data Screening and Assessment Conventions

Data validation was conducted on SRWMP water quality data throughout the year. The assessment screening process flags all data points outside a rolling minimum 12 value mean \pm 3 standard deviations.

Flagged data and short-term response plans for the SRWMP are reported quarterly to regulatory agencies as part of the water quality report. Data validation of "flagged data" for the year 2021 can be found in Appendix II.

Annual water quality reporting is designed to be concise and focused on the presentation of data in a standardized format with limited interpretation, as per Section 14.2 of the Implementation Document (Beak, 1999c). Data validation ensures prompt response to upset conditions or unusual results, as documented in *Data Validation Procedures* in conjunction with *Water Quality Assessment and Response Plan*, which is included in Appendix B of the SOE (Minnow, 2021). Assessment criteria as outlined in Table 2.4.a. and 2.4.b. of this report,

Page 11

2021 SRWMP Annual Water Quality Report

are standardized to benchmarks selected, rationalized and presented in *Appendix S, Tables S.1 and S.2 of the Cycle 5 SOE (Minnow, 2021).*

Approved program modifications implemented in January of 2020 focused water quality monitoring on lakes located immediately downstream of the decommissioned TMAs. An indepth and detailed statistical evaluation of water quality trends is included in the SOE produced every five years (Minnow 2009, 2011, 2017, 2021).

A SRWMP location summary of all annual average concentrations is reviewed and compared to assessment criteria in this report in Table 3.2. In addition, the most recent five-year annual concentrations of mine indicator parameters at key downstream locations are reviewed in this report in Figures 3.1.a to 3.1.c.

3 RESULTS

3.1 Data Quality Results and Assessment

Detailed laboratory quality assurance and quality control (QA/QC) results are provided in Appendix III, and detailed field QA/QC results are provided in Appendix IV. Field quality control results are summarized in Table 3.1. Data quality results and assessments are provided in the following sections. It should be noted that due to the closure of Perdue laboratories at Laurentian University and the radium-226 methodology issues at Testmark Laboratories, laboratory QAQC for radium-226 is reported from SGS beginning October 2021.

3.1.1 Laboratory Quality Assurance and Quality Control

In 2021, all analytical requirements for the SRWMP were contracted to laboratories with Canadian Association for Laboratory Accreditation Inc. (CALA) accreditations. (Appendix III). However, as noted above in Section 3.1, Quality Assurance and Quality Control results will only be reported from SGS.

Detailed laboratory QA/QC results are provided in Appendix III. The 10% objective for QA/QC was met. SGS performed 12836 analyses with 10387 QC checks, which represents 84.4% QC for sample analysis (Appendix III).

3.1.2 Quality Assurance and Quality Control Resolution of Key Issues

There were no major issues with laboratory analysis requiring resolution in 2021 (Appendix III).

3.1.3 Analytical Blank Performance

Laboratory quality control results confirm that blank data quality objectives were met for all parameters in all samples (Appendix III).

3.1.4 Analytical Duplicate Performance

Laboratory quality control results confirm that duplicate data quality objectives of 20% for radium and 10% for all other remaining parameters were achieved in all samples (Appendix III).

3.1.5 Analytical Laboratory Spike Performance

Laboratory quality control results confirm that the spike data quality objective of 20% was achieved for all parameters in all samples (Appendix III).

3.1.6 Analytical Certified Reference Material Performance

Laboratory quality control results confirm that the CRM data quality objective of 20% accuracy was achieved for all parameters in all samples in 2021 (Appendix III).

3.1.7 Field Blank Performance

Field Blank quality control results confirm that SRWMP field blank data quality objectives were achieved in 2021 (Appendix IV).

3.1.8 Field Precision Performance

The radium field precision objective of 20% was exceeded in 2 of 4 samples, at 33% and 57.1%. The exceedances occurred at low concentrations (< 0.021 Bq/L). The exceedances indicate some environmental variability at the time of sampling, but all values are representative of typical values observed at these locations; and therefore, the exceedances do not affect interpretation of radium water quality data. The annual average percent difference was slightly above the DQO at 26%. The lack of precision in these samples may also have been influenced by the inaccuracy of the methodology used by Testmark for radium analysis (see section 2.5 for details) All other field precision quality control results confirm that SRWMP field precision DQO's were achieved in 2021 (Appendix IV).

Table 3.1 2021 SRWMP Field Quality Control Results Summary

QA/QC	рН	SO4	Ra (T)	U	Ва	DOC	Fe	Mn	Hardness

Notes:

¹ Data Quality Objectives taken from Table 6.2 af the Cycle 5 Study Design for the SRWMP, SAMP and TOMP (Minnow, 2019) Bold indicates an exceedance in the Data Quality Objectives (DQO's)

3.2 2021 Annual Average Location Results Summary

Annual average concentrations of SRWMP parameters for 2021 in comparison to the Cycle 5 SOE (Minnow, 2021) receiving environment assessment criteria are provided in Table 3.2. Annual detailed results and five-year summaries of annual average concentrations in comparison to assessment criteria are provided in Appendix V.

Water quality throughout the Serpent River Watershed continues to meet and remain well below the assessment criteria established for the protection of aquatic life. Annual average concentrations for all parameters in 2021 were better than assessment criteria at all locations (Appendix V).

The annual average iron concentration at M-01 (Sherriff Creek outlet @ HWY 108) appears elevated compared to other SRWMP locations at 0.92 mg/L. However, it remained well below the assessment criteria established for wetland stations (2.49 mg/L, Table 2.4. a) and consistent with reference wetland stations SR-16 and SR-17 (Table 3.2). The 2020 annual average iron concentration at M-01 appears elevated as well (Appendix V), but is attributed to a seasonal spike (5.09 mg/L) in August when persistent upstream beaver activity was observed during a period of warmer, drier conditions and lower water levels. Iron concentrations are generally influenced by the particulate matter within the sample during periods of low flow. The remaining iron concentrations throughout the year were considerably lower (ranging from 0.22 mg/L to 0.51 mg/L) and more typical of expected values when flow is generally higher. This data can be found in the SRWMP Annual Water Quality Report 2020 (RAL, DMI, 2021).

Annual average barium concentrations at SR-06 (McCabe Lake Outlet) and further downstream at SR-15 (May Lake Outlet) have continued to decrease since 2018 (Appendix V) with average concentrations in 2021 at 0.138 mg/L and 0.87 mg/L, respectively (Table 3.2). The decrease is likely associated with the introduction of pre-formed barite at the upstream Stanleigh Effluent Treatment Plant (ETP) in 2018. Prior to 2019, barium concentrations at both SR-06 and SR-15 indicated an increasing trend, which was likely due to the increased barium chloride addition rates required for radium removal upstream at CL-06. The efficacy of the change to pre-formed barite indicates an improvement in radium removal and a reduction of residual barium in the CL-06 effluent and subsequently downstream at SR-06 and SR-15. Details of the preformed barite treatment method and CL-06 data can be found in the 2018, 2019 and 2020 *RAL Annual OCM Reports* (RAL, 2019, 2020, 2021). Although barium concentrations still appear elevated compared to other SRWMP stations, they are well below the assessment criterion (1.0 mg/L) and well below levels considered to be toxic to the aquatic environment (>8.0 mg/L; WHO 2001).

The annual average sulphate concentration at SR-08 (Nordic Lake Outlet) appears elevated (155.0 mg/l) compared to other SRWMP stations. However, as noted in section 2.2, according to the most recent approved water quality guidelines for aquatic life as published by BC ENV, manganese and sulphate are hardness dependent. Toxicity studies for both parameters demonstrated amelioration of toxicity with increasing water hardness and were used to develop new water quality guidelines in the province of British Columbia for these substances. Therefore, based on this information, a specific assessment criterion for sulphate has been established for each station in the SRWMP. In this case, the mean hardness concentration at SR-08 was determined to be 177.0 mg/L (Minnow, 2021) and thus, the resulting criterion for sulphate at this location is 309 mg/L. In 2021, all results at SR-08 fell within BC ENV guidelines for the protection of aquatic life (BC ENV, 2019). Sulphate assessment criteria for individual

Page 15

2021 SRWMP Annual Water Quality Report

stations and detailed results are included in Appendix V, as well as *Table S-1*, *Appendix S*, of the Cycle 5 SOE for the SRWMP, SAMP, and TOMP (Minnow, 2021).

3.3 Five-Year Annual Average Trends at Key Locations 2017-2021

Figures 3.1.a to 3.1.c show five-year trends of annual average concentrations for the minerelated parameters sulphate, radium-226, and uranium at the following key locations:

- SR-01, Quirke Lake Outlet;
- SR-06, McCabe Lake Outlet:
- SR-08, Nordic Lake Outlet;
- DS-18, Halfmoon Lake Outlet.

Based on a review of five years of data, annual sulphate concentrations at all key lake outlets are well below the assessment criterion of between 128-309 mg/L as established for each station. Furthermore, annual concentrations have been gradually decreasing at all locations over the past five years (Figure 3.1.a), with the exception of SR-08 (Nordic Lake Outlet) where a slight increase was observed in 2021; however, all results remained well below the assessment criterion of 309 mg/L, ranging between 140 mg/L – 170 mg/L (Appendix V).

With the exception of DS-18, annual average radium-266 concentrations are significantly lower than the assessment criterion of 0.469 Bq/L (Figure 3.1.b). At station DS-18, annual average radium concentrations appear elevated compared to other annual radium concentrations in the last five years (Appendix V). This may be indicative of flushing through the historic tailings spill upstream in the Halfmoon wetland area. However, all results in the last five years remained well below the assessment criterion of 0.469 Bq/L (ranging from 0.058 Bq/L to 0.221 Bq/L) and well below the Health Canada (2009) drinking water quality standard of 0.5 Bq/L.

Annual average radium-226 concentrations at SR-06 have continued to decrease since 2019 (Appendix V). This is likely associated with an approved alteration in the treatment process for radium-266 removal upstream at the Stanleigh ETP (RAL, 2019, 2020, 2021). Based on review of the five-year annual average data, all radium concentrations have consistently remained below the assessment criterion of 0.469 mg/L and well below Health Canada (2009) drinking water quality standard of 0.5 Bq/L (Figure 3.1.b).

Annual average uranium concentrations at all four key Lake locations appear to be relatively stable and were more than an order of magnitude below the assessment criteria of 0.0150 mg/L (Figure 3.1.c).

Table 3.2 2021 SRWMP Location Annual Average Results Summary

Parameters			рН	SO4 ⁵	DOC	Ra(T)	U	Ва	Fe	Mn ⁵	Hardness

4 DISCUSSION

4.1 Response Monitoring

Beginning in 2016, monitoring at the outlet of May Lake (SR-15) was voluntarily re-established in response to gradually increasing barium and radium concentrations upstream at the outlet of McCabe Lake (SR-06); it was previously removed in the *SRWMP Cycle 3 Study Design* (Minnow 2009). Although annual average concentrations have decreased substantially in the last three years, particularly at SR-06, the station SR-15 was re-established in the monitoring program as per the *Cycle 5 Study Design* (beginning 2020) to aid in the assessment of any long-term impacts to the receiving environment (Appendix V).

4.2 SRWMP Performance Monitoring Program Changes

There were no changes to program methodology in 2021. However, in response to the Cycle 4 SOE Report, the CNSC requested a review of the radium-226 benchmark used in the SRWMP for evaluating water quality in the receiving environment. In previous cycles, the Provincial Water Quality Objective (PWQO) value of 1 Becquerels per litre (Bq/L) (OMOE 1994) was used as the benchmark for evaluating radium-226 concentrations in the Serpent River Watershed (SRW). Based on this review, a site-specific water quality objective for radium-226 for the protection of aquatic life was derived. This new site-specific water quality objective is more meaningful specifically for the sampled locations. Going forward, the new approved site-specific water quality benchmark of 0.469 Bq/L for radium-266 will be used for water quality screening within future SRW assessments, rather than the historically used PWQO value of 1.0 Bq/L. Details of the review can be found in the *Cycle 5 Study Design* (Minnow, 2019).

2021 SRWMP Annual Water Quality Report

As previously mentioned in Section 2.2, after review of the *Cycle 5 Study Design* (Minnow, 2019), the MECP recommended adding DOC to the SRWMP monitoring program. This was in anticipation of a new federal environmental water quality guideline for iron currently posted for public review, which includes DOC and pH as toxicity modifiers. In addition, hardness continues to be monitored as an ancillary parameter to all SRWMP stations as it assists in the interpretation of water quality concentrations for manganese and sulphate, as discussed in the approved *Cycle 4 Study Design for the SRWMP, SAMP and TOMP* (BC ENV, 2019 and Minnow, 2016).

4.3 Changes to Location Classification and Frequency

Other than the re-establishment of the SRWMP station SR-15, there were no other changes to location classification or frequencies in 2021. However as noted in the Cycle 5 SOE, station D-6 is located in a habitat more characteristic of a wetland area, not a lake. Under this classification, D-6 was assessed based on wetland benchmarks (Photo set S.1, Appendix S, Minnow, 2021).

4.4 Representative Public Radiation Dose Estimation

The CNSC requested that RAL and DMI. provide annual reporting of the radiation dose to the public associated with the closed uranium mine sites in the Serpent River Watershed. Historically, estimates of the public dose had been based on the use of very conservative values to demonstrate that public dose in the vicinity of Elliot Lake did not exceed the upper dose limit. Measurements of radon and gamma collected during mine operations resulted in dose estimates less than 5% of the annual public dose limit of 1 mSv/a.

However, to determine an updated and more realistic representative annual public dose estimation for a person residing in Elliot Lake, a design monitoring program to support public dose estimation was prepared in early 2016. Details of the design program were provided in the document *Preliminary Design Monitoring Program to Support Public Dose Estimation (Ecometrix Incorporated* (Ecometrix), 2016, 2017), which was included as an appendix in the *SRWMP Annual Water Quality Report 2016* (RAL, DMI, 2017)

All components of the design monitoring program were completed in 2019 and it was concluded that the updated public dose is 0.01 mSv/a, two orders of magnitude lower than the regulatory public dose limit of 1 mSv/a. Details of the design monitoring program and the subsequent results are included in *Appendix U of the Cycle 5 SOE* (Minnow, 2021).

The public dose estimate will be reviewed, and if required, updated as part of the 2025 SOE.

APPENDIX I Performance Monitoring Changes 1999 - 2021 Evolution of Programs

Summary of Changes to the Elliot Lake Monitoring Programs (IBMP, TOMP, SAMP, and SRWMP) and Associated Documents^b

Cycle	Report Title	Year	Period Covered	Descriptions of Changes to the Monitoring Programs within Each Cycle				
	Serpent River Watershed Monitoring Program Framework Document	1999						
	In-Basin Monitoring Program Report	1999	historical monitoring data					
Cycle 1	Serpent River Watershed and In- Basin Monitoring Program – Implementation Document	1999		IBMP, TOMP, SAMP, and SRWMP were developed based on program objectives at existing monitoring data collected over the period of operations and decommissionin				
	Serpent River Watershed Monitoring Program -1999 Study	2001	4000 to 2000					
	In-Basin Monitoring Program for the Uranium Tailings Areas - 1999 Study	2001	1999 to 2000					
	Overview of Elliot Lake Monitoring Programs and Source Area Monitoring Program Design	2002		Changes only SRWMP most associated with optimization after first cycle of program				
	TMA Operational Monitoring Program Design (TOMP)	2002		was complete: • monitoring substances reduced to mine indicator parameters (barium, cobalt, DOC, iron, manganese, radium-226, selenium, silver, sulphate and uranium);				
Cycle 2	Cycle 2 Study Design – Serpent River Watershed and In- Basin Monitoring Programs	2004	2000 to 2004	 addition of two lake reference stations (Summers and Semiwite lakes) and 3 stream reference areas (SR-16, SR-17 and SR-18); removal of shallow lakes for sediment and benthic sampling (Westner, Grassy, Halfmoom, Upper Cinder and Horne lakes); 				
Cycle 2	Serpent River Watershed Monitoring Program: Cycle 2 Interpretive Report	2005	2000 to 2004	 removal of some stream sediment and benthic stations (D-15, SC-03 and SR-07); removal of Depot Lake and Serpent Harbour; addition of May Lake; the transfer of some SRWMP stations to SAMP or TOMP (N-12, ECA-131, P-11, 				
	Serpent River In-Basin Monitoring Program: Cycle 2 Interpretive Report - 2004 Study	2005		MPE and Q-23); and • fish health assessment eliminated based on performance, fish community assessment added for McCabe Lake and fish tissue monitoring reduced in scope				
	Serpent River Watershed State of the Environment	2009		based on performance.				

	Monitoring Framework For Closed Uranium Mines Near Elliot Lake	2009		IBMP eliminated based on objectives of program being achieved.			
	In Basin Monitoring Program, Cycle 3 Study Design	2009		TOMP and SAMP: • removal of silver, selenium based on performance and removal of conductivity based on redundancy with sulphate; and			
Cycle 3	Serpent River Watershed Monitoring Program: Cycle 3 Study Design	2009	2005 to 2009	DOC, hardness and flow added at selected stations. SRWMP:			
	Source Area Monitoring Program Revised Study Design	2009	2005 to 2009	 removal of selenium and sliver based on performance; removal of station SR-12, ELO, SR-09, SR-15, SR-02, SR-03, SR-11, P-01, QL-01 and SR-16 and SR-17 based on performance; monthly monitoring frequency reduced to quarterly; sediment and benthic monitoring removed from Whiskey, Evans and Cinder lakes based on redundancy; depositional streams (Q-20, D-6, SR-06, M-01 and SR-08) based on very high 			
	Tailing Management Area Monitoring Program (TOMP) Revised Study Design	2009					
	Serpent River Watershed State of the Environment Report	2011		natural variability masking results; and • fishing in McCabe Lake and fish tissue monitoring eliminated based on performance.			
Cyclo 4	Cycle 4 Study Design For the SRWMP, SAMP and TOMP	1 2014 1		Minor changes to TOMP and SAMP . SRWMP: • elimination of reference stations SR-05, P-222 and SR-14; • removal of cobalt as substance for monitoring, addition of DOC;			
Cycle 4	Serpent River Watershed Cycle 4 State of the Environment	2016	2010 to 2014	 far-field lakes removed from the program (Hough, Pecors, and McCarthy); removal of Rochester Lake as a sediment and benthic reference area; and reduction in benthic and sediment sampling to 1/10 years based on measured deposition rates. 			

Cycle 5	Cycle 5 Study Design For the SRWMP, SAMP and TOMP	2019	2015 to 2019	TOMP, SAMP, and SRWMP: • improved approach to trend analysis of surface water quality using the non-parametric seasonal Kendall test. SRWMP: • improved approach to calculate benchmark upper limit of background water quality values have previously been calculated based on the upper 95th percentile of values collect across all five years (rather than annual means); • use of a Serpent River Watershed site-specific dose-based radium-226 benchmark for assessment of water quality; • addition of a lake-specific dose-based radium-226 benchmark for assessment of sediment quality; and • sediment and benthic monitoring removed from Elliot Lake based on improvements in water quality, negligible mine-related sediment toxicity, and gradual improvement in benthic invertebrate communities.

^a Study Design was submitted to CNSC and JRG in 2014 but reissued with agency comments in 2016.

Notes: IBMP = In Basin Monitoring Program. TOMP = Tailings Management Area Monitoring Program. SAMP = Source Area Monitoring Program. SRWMP = Serpent River Watershed Monitoring Program.

APPENDIX II Flagged Data Results

SRWMP Data Flags Flags Revision 2020-01

Issued on: June 22, 2020

Expires on: June 22, 2024

Report Form: RC8.7.3.01

Location	Analyte	Date	Low	Hi	Result		Comment
D-5	DOC	2021-02-22	2.7	3.5	3.8 m	ıg/L	Result is slightly above the high flag limit, but consistent with historic values. DOC was discontinued in 2014, but re-established in 2020. Will continue to monitor at the current quarterly frequency.
D-6	DOC	2021-02-22	3.2	5.1	5.5 m	ıg/L	Result is slightly above the high flag limit, but consistent with historic values. DOC was discontinued in 2014, but re-established in 2020. Will continue to monitor at the current quarterly frequency.
D-4	hard	2021-11-11	8.5	9.0	9.2 1	mg/L	Result is slightly above the high flag limit, but consistent with previous values in the last three years.
	SO4	2021-11-11	2.9	2.9	2.8 1	mg/L	Result is a historic low, but only slightly below the low flag and may possibly be indicating a decreasing trend. Will continue to monitor at the current quarterly frequency.
FBR5	Ra	2021-11-10	0.007	0.007	< 0.005	Bq/L	Result is below the low flag limit, but consistent with a new lower laboratory detection limit.
SR-17	Ra	2021-11-18	0.005	0.010	< 0.005	Bq/L	Result is below the low flag limit, but consistent with a new lower laboratory detection limit.
SR-18	Ra	2021-11-18	0.006	0.009	< 0.005	Bq/L	Result is below the low flag limit, but consistent with a new lower laboratory detection limit.

APPENDIX III Laboratory QA/QC Results

REPORT CODE: DEN-ANN21

REPORT TITLE: Annual 2021 Denison Data Quality

Report

REVISION: 1.0

ISSUED BY:

Quality Coordinator,

SGS Environmental, Lakefield

AUTHORIZED BY:

Technical Manager,

Losers din

SGS Environmental, Lakefield

DATE: 22 Feb. 2022

Table of Contents

2.	QUALITY MANAGEMENT SYSTEM	3
3.	QUALITY CONTROL PARAMETERS	3
4.	NOTABLE OCCURANCES/ACTIONS	3
5.	QC DATA SUMMARY	4
5.1.	Blank Data	4
5.2.	Reference Material/Spiked Blank Data	4
5.3.	Duplicate Data	5
5.4.	Spike Duplicate Data	5
5.5.	QC Frequency	6

1. BACKGROUND

SGS Laboratory entered into an agreement with Denison Environmental Services for the analytical lab to provide analysis according to RFT #05-016. Please find below a summary of the laboratory quality management system, key actions taken by the laboratory, as well as a summary of numbers of samples analyzed.

2. QUALITY MANAGEMENT SYSTEM

SGS Environmental, Lakefield is accredited to ISO/IEC 17025 by the Canadian Association for Laboratory Accreditation (CALA), for specific tests listed in the scope of accreditation. ISO/IEC 17025 addresses both quality management and the technical aspects of operating a testing laboratory.

The quality management system at SGS Environmental consists of a documented quality system, which is directed by the Quality Coordinator who is independent of the production area. All appropriate documentation (quality manual, methods, written instructions, standard operating procedures, and data approval criteria) is in place and includes both general and method specific quality control requirements.

The quality control procedures include duplicate samples, spiked blanks, spiked replicates, reagent/instrument blanks, preparation control samples, certified reference material analysis, and instrument control samples, as appropriate for the individual methods. Matrix matching of reference materials to samples is always attempted. Frequency of insertion of control samples is method specific and follows legislated guidelines. A summary of the quality control recoveries is presented in the tables following.

3. QUALITY CONTROL PARAMETERS

All QC parameters are taken directly from SGS LIMS. Denison Environmental Services samples are processed as part of our "worksheet" batch system. A compilation of all QC data appropriate to the parameters tested has been compiled below.

4. NOTABLE OCCURANCES/ACTIONS

- SGS Environmental, Lakefield laboratory performed 12836 analyses with 10387 QC checks, which represents 84.4% QC for sample analysis. **Corrective Action**: N/A
- All blank data results were within the data quality objectives. Corrective Action: N/A
- All CRM/spike blank data results were within the data quality objectives. Corrective
 Action: N/A
- No duplicate value exceeded the data quality objectives. Corrective Action: N/A
- No spike duplicates fell outside of the data quality objectives. Corrective Action: N/A

Notor

Assessment criteria as per Table S.1, Appendix S, Cycle 5 State of the Environment Report for the SRWMP, SAMP and TOMP (Minnow, 2021)

² Benchmark applies to wetland stations: M-01, DS-18, SC-01.

³ Benchmark applies to lake stations: D-5, D-6, Q-09, Q-20, SR-01, SR-06, SR-08.

⁴ Method Detection Limits as per Table 6 2, Cycle 5 Study Design for the SRWMP, SAMP and TOMP (Minnow, 2019)

⁵ Sulphate and manganese criteria taken from Table S.2. Appendix S, Cycle 5 State of the Environment Report for the SRWMP, SAMP and TOMP (Minnow, 2021), Parameters are hardness Variation in number of significant figures reflect MDL's at the time of reporting. In 2006, laboratory reported MDL's were standardized to achieve consistency and meet program requirements, as per Cycle 2 Interpretive Report (Minnow 2005).
